

Email validation

It was the week start and new orders started to pile up for the Order processing team at Devo shipments. Thushith, from the team noticed that the new shipment orders had incorrect e-mails Ids, that is the e-mail Ids contained some invalid domain names. He in turn raised a concern to his colleague who has working for the Dev Sup team and is responsible to fix any malfunctioning of their Date X Shipment Management Software.

He identified that the e-mail validation module in the system failed and did not validate the domain names in the e-mail Ids. Justin rushed into action to fix the same and he needs your support to swiftly perform the task. Help him write a correct e-mail validation code.

Specification:

-->Use substring() method

-->Valid Domain names to be considered for the sake of the problem are **com,biz,net and org**. All the other domains like **us,in,info** are considered invalid.

Input Format:

Input consists of the String that corresponds to the E-mail id on the shipment orders.

Output Format:

Output consist of String which displays whether the domain in the given email.id is a valid domain or not.
